Problem Statement

The purpose of Information Technology (IT) is to enable the work of the institution. Yet, the way IT is delivered at UW-Madison is often out of step with the needs of our constituents, inflexible, and expensive.

This lack of alignment and overall strategy leads to challenges with integrating data across IT systems and business domains, costly and complex integration projects owing to lack of common data definitions and principles across enterprise systems, and difficulty engaging IT to solve business problems. It also results in inconsistent, impersonal experiences for end users and tremendous effort to bridge the gaps between our systems and services.

Vision and Objectives

The Interoperability Transformation Initiative aims to modernize the ways we connect and manage our digital infrastructure and services, and to do so at pace and at scale. This transformation effort will enable us to access, exchange, and cooperatively use information across our complex organization to ensure that learners, faculty, staff, and community members are able to easily and securely use the systems and tools they need. By harnessing our data and infrastructure, we will enable more personalized experiences, appropriate **security and privacy controls**, and better ensure that information is accurate and up-to-date across the ecosystem.

Timeline

The following timeline represents activities we have undertaken up to this point. A more detailed implementation timeline representing future and ongoing activities is included as an appendix.

- December 2018: We kicked off this initiative by gathering a diversity of campus pain points and needs, resulting in more than 200 user stories. These needs helped us better understand the problem space and connect with constituents.
- January 2019: A three-week discovery sprint was used to further explore the challenges in the current state and engage with campus partners to help think about the future. This discovery sprint included checkpoints with campus constituents and conversations with vendors and external partners.
- **February 2019:** Based on the discovery sprint findings, we continued to refine what the future will look like and the various **potential component projects**.
- March 2019: Developed staffing and high-level funding estimates based on current understanding. Began socializing and onboarding staff.
- April 2019: Made funding request and began outward communications, staff training, commenced phase 0
 activities and deliverables.
- Ongoing: We have learned that ongoing communication, campus engagement, and feedback will be key to
 the success of this initiative. So, too, will be an investment in evolving how we work, how we organize
 ourselves, and how we serve our constituents.

April 12, 2019

Recommendations

This document sets out our recommended strategy for how to proceed in the next several months, including program creation, user-facing, and infrastructure projects, along with estimated timelines and resource needs.

Phased Approach

The following phased approach will enable us to establish a program required to implement the Interoperability Framework Projects thereafter.

- Phase 0: April through July 2019; pre-implementation steps
- Phase 1: July through September 2019; quick wins and enacting program creation
- Phase 2: October 2019 through June 2020; intermediate and beginning of implementation projects
- Phase 3: July 2020 and beyond; implementation projects on-going and well-established

Program

While a primary focus of the interoperability discovery exercise has been to understand the technical infrastructure needed to achieve interoperability, we heard emphatically from campus partners the importance of getting the user experience right and of putting in place services, systems, governance, and communication to sustain and evolve the effort in the long run. (See <u>Appendix B: Interoperability Metaphor</u>)

Interoperability Service Design and Practice

Adopt **service design principles and practices** to ensure that teams working on designing, building, supporting, and delivering interoperability projects work closely together to accurately understand the needs of constituents, design end-to-end solutions, and continue to evolve interoperability services.

- Interoperability Service Principles (see <u>Appendix A: DRAFT Interoperability Service Principles</u>) Service
 principles will help us keep quality high, speed up implementation, embed security and accessibility, ensure
 interoperability, enable collaboration, and create a common vision to work towards. This working draft has
 been informed by the discovery exercise and preliminary campus input. Next steps are to share more
 widely, within DoIT and with campus partners, to refine and build support.
- Interoperability Service Manual To put these principles into practice, we will need to develop more
 specific operations-in-practice guidance with specifics for interoperability projects and services. We've
 begun to gather information to inform this effort and conflicts we anticipate and then to begin to determine
 the best ways to navigate them.

April 12, 2019

Organizational Change Management

The Interoperability Transformation Initiative will fundamentally change the way campus accesses, shares, and works with systems and data. Asking campus stakeholders and partners to move from the current state of operations to new ways of working and new systems will impact all users.

To ensure program acceptance and adoption, we will need to put in place a **well-defined change management plan** that emphasizes engagement and transparency, and clear and proactive communication of high-level sequencing and impacts. An effective change management plan will mitigate obstacles and risks, engage campus in the entire process, motivate our partners to move toward common goals, and ensure the success of the overall program.

Interoperability Service Management

Develop an Interoperability Service Management framework (see <u>Appendix C: Interoperability Service</u> <u>Management</u>) framework that will allow us to effectively make decisions about **service lifecycle**, create **capacity** to do interoperability projects, and **engage campus**. Additionally, this framework will inform how we do staff augmentation across near- and long-term time frames to enable implementation, operation, and professional development.

Finally, we will begin to operate with a DevOps-focused mindset (see <u>Appendix D: DevOps Diagram</u>) that enables multi-disciplinary teams to incorporate security, test-driven design, and shared ownership of service delivery throughout the entirety of our service management stack.

Interoperability Framework Projects

This section outlines recommended user-facing services and underlying infrastructure to enable the delivery of the recommended Interoperability Transformation Initiative outcomes.

- For timeline information, see <u>Appendix E: Summary Timeline</u> and <u>Appendix F: Summary Timeline</u> <u>Descriptive Table</u>.
- Current state diagrams can be found in <u>Appendix G: Current State of Integration</u>.
- Future state diagrams can be found in <u>Appendix H: Phase 1 Deliverables</u> through <u>Appendix J: Phase 3 Deliverables</u>.

Domain Driven Design and Enterprise Business Objects (EBOs)

- Define business domains, under the leadership of <u>Office of Data Management and Analytics Services</u>, around which data, policies, and integrations will be built. Define enterprise business objects (EBOs) within business domains.
- Implement functionality to transform data from authoritative systems into the EBO representation for each business domain. Encapsulate internal domain processes and business logic away from external domain interactions. Provide common functional interfaces for integrating with a domain that are consistent with the structure of other domains.

April 12, 2019

End-User Facing

- Create both self-service and guided experiences for campus to easily integrate with data, supported by an
 integration team whose purpose is to facilitate engagements and advocate preferred patterns and access
 methods while meeting business needs.
- Shift to an "identity first" and personalized approach, creating a **digital profile** with the UW that can be enriched with institutional roles, information, and preferences (e.g. preferred name) that evolves as people navigate our ecosystem over time.
- Improve **login experience** to enable multimodal access methods, like social login, to better meet the diverse needs of all people engaging with the University. Incorporate appropriate secure access methods based on role and level of access (e.g. multi-factor authentication).

Integration Platform

- Implement an integration platform that enables the expression of domain data using common standards and modern integration patterns and that enables the secure control of institutional data flow.
- Promote API and event-based integrations over ETL¹-based integrations. Where we need to support ETL-based integrations, remain consistent with EBOs expressed via API and event-based integrations.
- Incorporate a **developer portal** into the integration platform that enables campus users to understand data models, test, and request production access to services exposed by the integration platform.

Identity and Access Management

- Modernize our Identity and Access platform to enable integration across business domains of data to express institutional roles.
- Create and curate institutional role definitions to enable role-based provisioning.
- Develop a resource catalogue of institutional and departmental resources provisioned based on roles and ad-hoc requests.

¹ Extract, transform, load data, often via data files, enabling shadow-copies on remote systems

April 12, 2019

Appendix A: DRAFT Interoperability Service Principles

The Interoperability Service Principles are a set of 14 criteria developed in response to campus needs and pain points. These principles will help to ensure that we design and run high quality interoperability services.

1. Make sure users succeed the first time

Create a service which is simple to use and intuitive enough that users succeed the first time, wherever, whenever, and however they engage with a service. Research to develop a deep knowledge of who service users are, their contexts, and how their needs may change over time. Do ongoing testing to seek feedback from users to improve the service.

2. Have a multidisciplinary team; assign a leader

Put in place a sustainable multidisciplinary team that can design, build, and operate the service. When outside help is needed, teams should pair with contractors who are good at both building and delivering effective digital services. Teams should be led by a suitably skilled service or business owner with decision-making authority and experience.

3. Design and build for change

Take the time to understand how to design and build a resilient, flexible, and sustainable service and underlying infrastructure. Build your service using agile, iterative, and user-centered methods and ensure that you have the capacity, resources, and technical flexibility to iterate regularly. Emphasis should be placed on being scalable, automated, appropriately self-service.

4. Evaluate tools and systems

We should know the risks and constraints associated with a tool or system and avoid contracts that lock us in and stop us from improving our services. Rigorously evaluate what tools and systems will be needed to build, host, operate and measure the service, and how to procure them. Evaluate solutions based on campus standards and requirements, independent of vendor design.

5. Use enterprise data and standards, and common platforms

Enterprise data and standards and common platforms save time and money by reusing things that are already available, ensures that your technology works and communicates with other technology, and is easily upgraded and expanded.

6. Ensure security and privacy

Our services must keep sensitive data secure and ensure that users can access their information when they need to. Evaluate what data and information your service will be providing or storing and address the security level, legal responsibilities, privacy issues, and risks associated with the service, consulting with experts where appropriate.

7. Make things accessible

All users will have different needs at different times and in different circumstances. Make sure your technology, infrastructure, and systems work for as many users as possible by including accessibility, internationalization, and low- to no-tech users in your research and design.

April 12, 2019

8. Test the end-to-end service

Individual parts of a service may work in controlled environments but need to work end-to-end and for the numbers of people who want to use them. Be able to test, ideally in an automated fashion, the end-to-end service in an environment identical to that of the live version. Include all common browsers and devices, use test credentials that approximate real users, and test with a representative sample of users.

9. Make a plan for being offline

You need to have a plan for what to do if your service goes offline so that you know how users will be affected and how to get it back online. Ensure that service availability is communicated, users are supported, and that we learn from and take steps to avoid future issues.

10. Identify, collect, and report performance data

Setting and tracking performance indicator allows us to continuously improve our services by understanding strengths and weaknesses, and using data to support improvements. Identify performance indicators for the service, including the mandatory performance indicators defined in the manual [TBD]. Establish a benchmark for each metric and make a plan to enable improvements.

11. Be open, encourage engagement

When we collaborate in the open, we can improve IT together. Make it easy for campus and external partners to adopt and adapt to our interoperability service standard. Ensure that information is understandable and readily accessible. Proactively communicate information, impacts, and decisions. Engage key stakeholders in the process. Document and appropriately share systems, data, and infrastructure.

12. Make the user experience consistent with UW brand

Every interaction a user has with the University contributes to their assessment of and trust in the institution. Build a service consistent with UW brand guidelines, including using the design patterns and voice and style guides.

13. Structure budgets to support delivery

If cost is a barrier to using enterprise data, standards, and platforms, our campus partners will look elsewhere for solutions, further contributing to the complexity of our technology ecosystem. To improve our chances of success, we need to make it easy to the right thing.

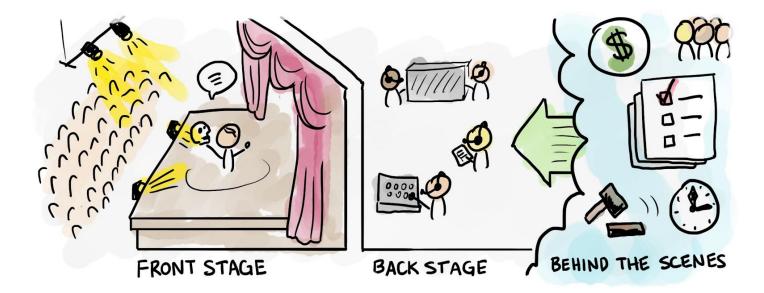

14. Test with leadership

Leaders are accountable for the technology and services produced by their teams. Test the service from beginning to end with the leaders responsible for it.

April 12, 2019

Appendix B: Interoperability Metaphor

While a primary focus of the Interoperability Discovery Exercise, conducted in January 2019, was to understand the technical infrastructure needed to achieve interoperability, we heard emphatically from campus partners the importance of getting the user experience right and of putting in place services, systems, governance, and communication to sustain and evolve the effort in the long run.

We have used the above theater metaphor to describe the Interoperability Transformation Initiative and domain. We believe this metaphor has value as a tool to communicate about the problem space and the initiative at large.

- **Front stage** represents services and applications in our portfolio that people of all roles interact with. Examples include profile management, developer portal, and concierge/consulting services.
- **Back stage** represents services and infrastructure needed to deliver the front stage services and applications. Examples include IAM, the integration platform, and enterprise business objects.
- Behind-the-scenes represents foundational elements needed to effectively deliver the complete portfolio.
 Examples include a service standard (i.e. guiding principles), funding, governance, change management, etc.

April 12, 2019

Appendix C: Interoperability Service Management

Phased Approach

The following phased approach will enable us to establish a program required to implement the Interoperability Framework Projects thereafter.

- **Phase 0**: April through July 2019; pre-implementation steps
- Phase 1: July through September 2019; quick wins and enacting program creation
- Phase 2: October 2019 through June 2020; intermediate and beginning of implementation projects
- Phase 3: July 2020 and beyond; implementation projects on-going and well-established

Service Lifecycle

Develop and implement a service lifecycle framework that allows us to make decisions about when to take on work, freeze development of work and projects deemed out-of-alignment with the Interoperability strategy, and sunset technologies and services where appropriate.

Phase	Activities
0	 Develop criteria that will allow us to be disciplined and transparent to campus about service lifecycle decisions. These criteria should help us determine the following for each portfolio service: Continue current development commitments and take on new work Freeze new development but complete in-flight commitments Freeze all new development and in-flight commitments Shift operations of service to different area within DoIT or campus Sunset actively or through attrition Perform assessment of existing AIS portfolio against criteria Make recommendations to leadership, and obtain sign-off, based on findings
1	Begin communicating intention and perform impact assessment following service lifecycle recommendations
2	 Continue implementing service lifecycle recommendations Reassess service lifecycle recommendations to account for new service and infrastructure that are or will be available
3	 Complete implementation of service lifecycle recommendations Begin transitioning campus to newly developed services and infrastructure to enable implementation of updated service lifecycle recommendations

April 12, 2019

DevOps

DevOps is the intersection of development, operations, and agile methodologies; it is a set of practices and an organizational culture that suggests a unified approach to service delivery across the entire stack (i.e. development, testing, monitoring/alerting, operations/support, service management). Preliminarily, we believe DevOps means we should do the following:

- Build in automation, monitoring, and alerting
- Test-driven design and automated testing
- Alignment with risk management framework
- Infrastructure as code to enable rapid re-deployment and updates
- Multidisciplinary teams, minimize siloes, cross-train competencies
- Standardized operations including service delivery
- Develop metrics and instrumentation recommendations

Phase	Activities
0	 Develop concrete definition of what DevOps means to the Interoperability Program Assess in-house skills around DevOps champion(s) and practices
1	 Begin organizing teams to enable execution of DevOps Assess tooling needs to enable DevOps, particularly automated testing
2	 Use DevOps-structured, multi-functional teams to do implementation Tweak structure of teams based on practical lessons learned during implementation Purchase and/or implement DevOps tooling
3	 Continue operation as a DevOps team, augmenting with additional parts of Core Ops as restructuring continues

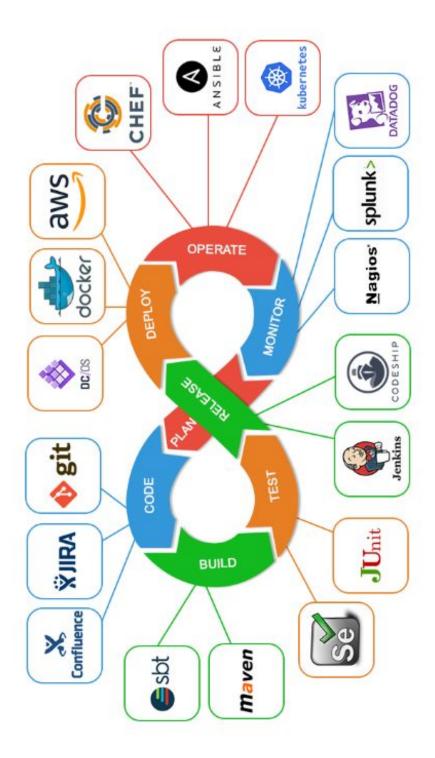

April 12, 2019

Service Management

Establish consistent service management, decision-making, campus communication, and service governance practices that will be needed for long-term success. Apply principles outlined in the <u>Service Principles</u> to ensure high quality digital services across Interoperability.

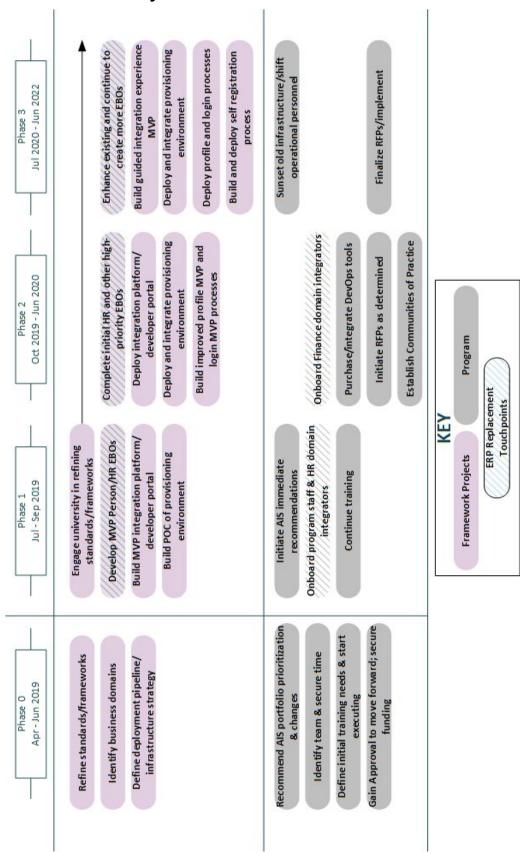

Phase	Activities
0	 Align with UW cloud strategy (i.e. decision-making and best practices around on-premises, hybrid, cloud deployments) Assess limitations, challenges, and gaps in current portfolio that might be out of alignment with strategies above Develop decision-making guidance around build, buy, value-added customizations
1	 Determine how decisions should be made that will govern the implementation projects, when to escalate to leadership, and what guidance/checkpoints we will need throughout Create sponsorship and steering and advisory committee(s) Determine funding gaps in current state, accounting for service lifecycle recommendations
2	 Develop communities of practice that will serve as checks and balances to the implementation and ensure campus buy-in Continuously evaluate funding to ensure appropriate levels of campus support for Interoperability ("greater good") services and infrastructure
3	 Continue working with communities and practice and advisory committees to retain strong partnership with campus, ensuring long-term success

Appendix F: Deliverables

Note: Touch points with ERP replacement effort are **bolded and highlighted in blue**. <u>Framework projects</u>: what we are going to do. <u>Program</u>: how we are going to execute.

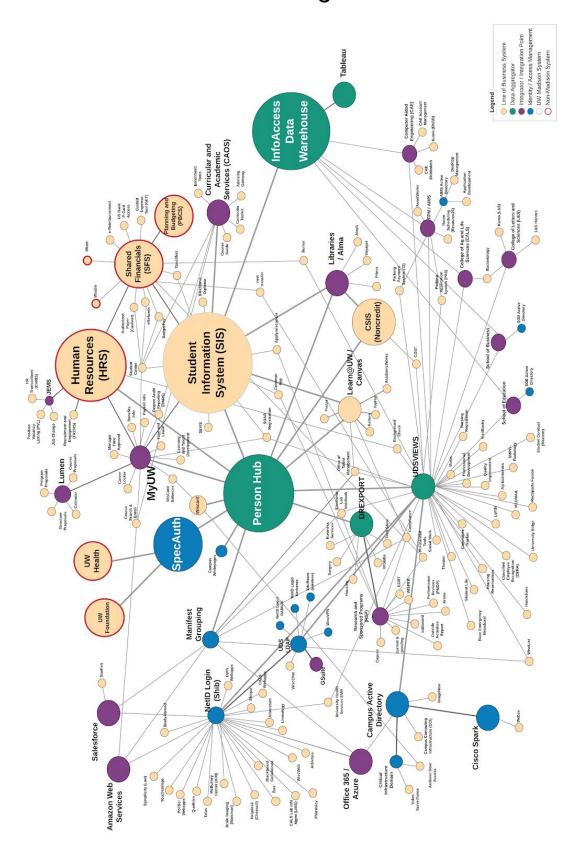

Pha se	Dates	Key Deliverables	Capabilities
0	Apr - Jun 2019	Framework Projects Refined service design principles, including UW feedback Business domains identified Deployment pipeline and infrastructure strategy defined Program Recommended AIS portfolio prioritization and changes Define initial training needs; identify and begin training staff in foundational areas needed to start phase 1 (e.g. DevOps, Domain-driven design) Recommendations for non-DoIT and non-UW staffing (see costs) Charter and basic plans in place and signed off on	Framework Projects - Service design framework for project design and implementation - Consultation with partners to align with interoperability projects - Confidence in approach and attentiveness to user & business needs - Build/buy decision-making, cloud strategy intersection Program - AIS Interoperability staff commitment to projects - Staff able to begin DevOps/foundational work needed on all projects - Supplement DoIT staff, minimize cost of outside augmentation - Define high-level performance metrics
1	Jul - Sep 2019	Framework Projects - Design Principles into practice, including first rounds of user research, design, usability and accessibility testing, KPIs, etc. - MVP of Person and HR EBOs developed - MVP of Integration Platform available to expose APIs - Initial Developer Portal in testing with users - POC of provisioning environment (Internet2 TIER model); select coarse-grained roles defined - Recommendation to use existing Integration Platform or begin RFP Program - New staff and contractors onboarded - Complete immediate recommendations of projects/services to shift staff to new projects - Interoperability program staff training plan complete and in flight - HR domain integrators onboarded to ERP project/RFP team	Framework Projects - Development of an MVP end-to-end system that enables university developers to obtain Person and HR (job) data through a integration platform - APIs deployable to common Integration Platform - UW users able to see EBOs and integration with existing Person, HR APIs Program - Developer/integrator staff backfill underway, shifting to new projects - Understand user and business needs, iterate - Defined more detailed performance metrics - Integrators to leverage existing HR knowledge to start work in this business domain first; ramp up presence in other domains iteratively

April 12, 2019

2	Oct	Framework Projects	Framework Projects
	2019 -	- Refined design principles, practices, and	- University developers able to obtain HR/person
	Jun	decision-making	data through the Integration Platform
	2020	- HR and high-priority EBOs completed, iteration	- Integration Platform RMF assessment underway,
		from MVP	reduced risk for users of platform
		- Integration Platform and Developer Portal deployed	- Provisioning service established; onboard
		to production	University users to safer, easier-to-implement
		- Deploy provisioning components to production	provisioning methods
		- Integration of provisioning with event hub to	- Early improvements for login and profile
		populate live data	management available for feedback
		- MVP of improved Profile deployed to test	<u>Program</u>
		- MVP of improved Login process deployed to test	- Apply learnings from early efforts, refine practices
		Program	accordingly
		- Communities of practice established	- Developer/integrator multi-functional teams fully
		- Finance domain integrators onboarded to ERP	established
		project/RFP team	- Participate and begin building domain knowledge
		- Recommendations for funding adjustments	for ERP replacement project(s)
		- DevOps tooling purchased to fill in gaps	- Able to perform DevOps (e.g. test automation)
		- All remaining RFPs created and in-flight	activities at scale
3	Jul	Framework Projects	Framework Projects
3	Jul 2020 -	Framework Projects - Enhancements to existing and completion of	Framework Projects - MVP of ERP integration capabilities in production

3	2020 - Jun	- Enhancements to existing and completion of remaining EBOs in production - Guided integration experience MVP developed for non-technical users - Role-based access API MVP developed - Improved Profile and Login systems deployed to production - Self-service registration deployed into production Program - Recommendations based on feedback and performance metrics - Transition plan to sunset old infrastructure and	- MVP of ERP integration capabilities in production and Interoperability team working with project to meet ongoing needs - University developers do not need to directly integrate with new HR system - All university users able to use improved login and profile management - Improved login and profile management capabilities available to all - Self-service profile registration capabilities available to all Program - Continue to apply learnings from early efforts, refine practices accordingly - Roadmap to sunset old and fully transition to new

- AIS Application Infrastructure Services department within DoIT; responsible for bulk of Interoperability projects
- API Application Programming Interface; automated means of access to data and processes
- DevOps the intersection of development, operations, and agile methodologies; practices & culture that suggests a unified approach to service delivery
- EBO Enterprise business object; an institutionally accepted (set of) definition(s) for a business object (e.g. enrolled student)
- MVP Minimally viable product; the simplest, unrefined potentially releasable increment of a product or service
- Internet 2 TIER Trust and Identity in Education and Research; standardization of technologies and practices in Identity and Access Management domain
- RMF Risk Management Framework; Cybersecurity's review, risk assessment, and security recommendation process
